1. Executive Summary

The State of Arizona required the administration of member satisfaction surveys to Medicaid members enrolled in the Arizona Health Care Cost Containment System (AHCCCS) Mercy Maricopa Integrated Care (Mercy Maricopa) Program. AHCCCS contracted with Health Services Advisory Group, Inc. (HSAG) to administer and report the results of the Consumer Assessment of Healthcare Providers and Systems (CAHPS®) Health Plan Survey. The goal of the CAHPS Health Plan Survey is to provide performance feedback that is actionable and that will aid in improving overall member satisfaction. The CAHPS results presented in the report represent a baseline assessment of member satisfaction with the Mercy Maricopa Program; therefore, caution should be exercised when interpreting these results.

The standardized survey instrument selected was the CAHPS 5.0 Adult Medicaid Health Plan Survey with the Healthcare Effectiveness Data and Information Set (HEDIS®) supplemental item set. Adult members from the Mercy Maricopa Program completed the surveys from December 2016 to March 2017.

Performance Highlights

The Results section of this report details the CAHPS results for the Mercy Maricopa Program. The following is a summary of the Adult CAHPS performance highlights for the Mercy Maricopa Program. The performance highlights are categorized into three areas:

- NCQA Comparisons
- Rates and Proportions
- Priority Assignments

---

1-1 CAHPS® is a registered trademark of the Agency for Healthcare Research and Quality (AHRQ).
1-2 HEDIS® is a registered trademark of the National Committee for Quality Assurance (NCQA).
NCQA Comparisons

Overall member satisfaction ratings for four CAHPS global ratings (Rating of Health Plan, Rating of All Health Care, Rating of Personal Doctor, and Rating of Specialist Seen Most Often), four CAHPS composite measures (Getting Needed Care, Getting Care Quickly, How Well Doctors Communicate, and Customer Service), and one individual item measure (Coordination of Care) from the 2016 MMIC CAHPS survey results were compared to NCQA’s 2017 HEDIS Benchmarks and Thresholds for Accreditation.1-3,1-4 This comparison resulted in ratings of one (★) to five (★★★★★) stars on these CAHPS measures, where one is the lowest possible rating and five is the highest possible rating.1-5 The detailed results of this comparative analysis are described in the Results section beginning on page 3-2. Table 1-1 presents the highlights from this comparison.

Star Assignments Based on Percentiles

★★★★★ 90th or Above ★★★★ 75th-89th ★★★ 50th-74th ★ 25th-49th ★ Below 25th

1-4 NCQA’s benchmarks and thresholds for the adult Medicaid population were used to derive the overall member satisfaction ratings; therefore, caution should be exercised when interpreting these results.

1-5 NCQA does not publish benchmarks and thresholds for the Shared Decision Making composite measure and Health Promotion and Education individual item measure; therefore, overall member satisfaction ratings could not be derived for these CAHPS measures.
Rates and Proportions

The rates and proportions for the Mercy Maricopa Program were compared to 2016 NCQA Adult Medicaid Quality Compass® data. These comparisons were performed on the four global ratings, five composite measures, and two individual item measures. The detailed results of these analyses are described in the Results section beginning on page 3-3. The following are highlights of this comparison:

- The Mercy Maricopa Program scored at or above the national average on two measures: Getting Care Quickly and Getting Needed Care.

Priority Assignments

Based on the results of the NCQA comparisons, priority assignments were derived for each measure. Measures were assigned into one of four main categories for quality improvement (QI): top, high, moderate, and low priority. These priority areas are described in the Recommendations section of this report beginning on page 4-1. The following are the top priority areas for the Mercy Maricopa Program:

- Rating of Health Plan
- Rating of All Health Care
- Rating of Personal Doctor
- Rating of Specialist Seen Most Often
- Getting Care Quickly
- How Well Doctors Communicate
- Customer Service
- Coordination of Care

---

1-6 Quality Compass® is a registered trademark of the National Committee for Quality Assurance (NCQA).
1-7 NCQA national averages for the adult Medicaid population were used for comparative purposes. Given the potential differences in the demographics of these populations (i.e., adult Medicaid and MMIC), caution should be exercised when interpreting these results.
Survey Administration and Response Rates

Survey Administration

Members eligible for surveying included those who were enrolled in the Mercy Maricopa Program at the time the sample was drawn and who were continuously enrolled in the Mercy Maricopa Program for at least five of the last six months of the measurement period (October 2015 through March 2016). In addition, members also had to be 18 years of age or older as of March 31, 2016 to be included in the survey.

The standard NCQA HEDIS Specifications for Survey Measures requires a sample size of 1,350 members for the CAHPS 5.0 Adult Medicaid Health Plan Survey. For the Mercy Maricopa Program, a 20 percent oversample was performed on the adult population. Based on this percentage, a sample of 1,620 adult members was selected from the Mercy Maricopa Program. The oversampling was performed to ensure a greater number of respondents to each CAHPS measure.

The survey administration protocol was designed to achieve a high response rate from members, thus minimizing the potential effects of non-response bias. The survey process allowed members two methods by which they could complete the surveys. The first, or mail phase, consisted of a survey being mailed to the sampled members. For the Mercy Maricopa Program, those members who were identified as Spanish-speaking through administrative data were mailed a Spanish version of the survey. The cover letter provided with the Spanish version of the CAHPS questionnaire included a text box with a toll-free number that members could call to request a survey in another language (i.e., English). Members that were not identified as Spanish-speaking received an English version of the survey. The cover letter included with the English version of the survey had a Spanish cover letter on the back side informing members that they could call the toll-free number to request a Spanish version of the CAHPS questionnaire. A reminder postcard was sent to all non-respondents, followed by a second survey mailing and reminder postcard. The second phase, or telephone phase, consisted of Computer Assisted Telephone Interviewing (CATI) for sampled members who had not mailed in a completed survey. Up to six CATI calls were made to each non-respondent. Additional information on the survey protocol is included in the Reader’s Guide section beginning on page 5-3.

Response Rates

The CAHPS Survey administration was designed to achieve the highest possible response rate. The CAHPS Survey response rate is the total number of completed surveys divided by all eligible members of the sample. A survey was assigned a disposition code of “completed” if at least three of the following five questions were answered: questions 3, 15, 24, 28, and 35. Eligible members included the entire sample minus ineligible members. Ineligible members met at least one of the following criteria: they were deceased, were invalid (did not meet the eligible population criteria), had a language barrier, or were mentally or physically incapacitated.

A total of 454 adult members returned a completed survey. Figure 2-1, on the following page, shows the distribution of survey dispositions and response rate for the Mercy Maricopa Program.
The Mercy Maricopa Program’s response rate of approximately 29.0 percent was greater than the national Adult Medicaid response rate reported by NCQA for 2016, which was 24.8 percent.²⁻³

²⁻² The “Other” ineligible records category includes members who were deceased or were mentally or physically incapacitated.

Respondent Demographics

In general, the demographics of a response group may influence overall member satisfaction scores. For example, older and healthier respondents tend to report higher levels of member satisfaction; therefore, caution should be exercised when comparing populations that have significantly different demographic properties.2-4 Currently, NCQA does not recommend case-mix adjusting Medicaid CAHPS results to account for these differences.

Table 2-1 shows respondents’ self-reported age, gender, race, and ethnicity for the adult Medicaid population.

3. Results

The following presents the CAHPS results for the adult population for the MMIC program. The CAHPS results presented in this section represent a baseline assessment of the adult members’ satisfaction with the Mercy Maricopa Program.

NCQA Comparisons

In order to assess the overall performance of the Mercy Maricopa Program, each of the CAHPS global ratings (Rating of Health Plan, Rating of All Health Care, Rating of Personal Doctor, and Rating of Specialist Seen Most Often), four of the CAHPS composite measures (Getting Needed Care, Getting Care Quickly, How Well Doctors Communicate, and Customer Service), and one individual item measure (Coordination of Care) were scored on a three-point scale using the scoring methodology detailed in NCQA’s HEDIS Specifications for Survey Measures. The resulting three-point mean scores were compared to NCQA’s HEDIS Benchmarks and Thresholds for Accreditation. Based on this comparison, ratings of one (★) to five (★★★★★) stars were determined for each CAHPS measure, where one is the lowest possible rating and five is the highest possible rating.

★★★★★ indicates a score at or above the 90th percentile
★★★★ indicates a score at or between the 75th and 89th percentiles
★★★★ indicates a score at or between the 50th and 74th percentiles
★★★ indicates a score at or between the 25th and 49th percentiles
★★ indicates a score below the 25th percentile

---

3-3 NCQA does not provide benchmarks and thresholds for the Shared Decision Making composite measure and the Health Promotion and Education individual item measure; therefore, overall member satisfaction ratings could not be determined for these CAHPS measures.
3-4 NCQA’s benchmarks and thresholds for the adult Medicaid population were used to derive the overall satisfaction ratings; therefore, caution should be exercised when interpreting these results.
Table 3-1 shows the Mercy Maricopa Program’s three-point mean scores and overall member satisfaction ratings on each of the four global ratings, four composite measures, and one individual item measure.

Star Assignments Based on Percentiles
★★★★★ 90th or Above ★★★★ 75th-89th ★★★ 50th-74th ★★ 25th-49th ★ Below 25th

Summary of NCQA Comparisons Results

The NCQA comparisons revealed the following summary results:

- The Mercy Maricopa Program did not score at or above the 50th percentile on any of the measures.
- The Mercy Maricopa Program scored at or between the 25th and 49th percentiles on one measure, Getting Needed Care.
- The Mercy Maricopa Program scored below the 25th percentile on eight measures: Rating of Health Plan, Rating of All Health Care, Rating of Personal Doctor, Rating of Specialist Seen Most Often, Getting Care Quickly, How Well Doctors Communicate, Customer Service, and Coordination of Care.
Rates and Proportions

For purposes of calculating the results, question summary rates were calculated for each global rating and individual item measure, and global proportions were calculated for each composite measure. Both the question summary rates and global proportions were calculated in accordance with NCQA HEDIS Specifications for Survey Measures. The scoring of the global ratings, composite measures, and individual item measures involved assigning top-level responses a score of one, with all other responses receiving a score of zero. After applying this scoring methodology, the percentage of top-level responses was calculated in order to determine the question summary rates and global proportions. For additional detail, please refer to the NCQA HEDIS Specifications for Survey Measures, Volume 3.

Global Ratings

Figure 3-1 depicts the top-box question summary rates for each of the global ratings for the Mercy Maricopa Program and the 2016 NCQA National Adult Medicaid average using responses of 9 or 10 for top-box scoring.3-6,3-7

![Figure 3-1—Global Ratings: Question Summary Rates](image)

3-6 For the NCQA national adult Medicaid averages, the source for data contained in this publication is Quality Compass® 2016 data and is used with the permission of the National Committee for Quality Assurance (NCQA). Quality Compass 2016 includes certain CAHPS data. Any data display, analysis, interpretation, or conclusion based on these data is solely that of the authors, and NCQA specifically disclaims responsibility for any such display, analysis, interpretation, or conclusion. Quality Compass is a registered trademark of NCQA. CAHPS® is a registered trademark of the Agency for Healthcare Research and Quality (AHRQ).

3-7 NCQA national averages for the adult Medicaid population were used for comparative purposes. Given the potential differences in the demographics of these populations (i.e., adult Medicaid and MMIC), caution should be exercised when interpreting these results.
For each global rating question, responses were classified into one of three response categories: “0 to 6 (Dissatisfied),” “7 to 8 (Neutral),” and “9 to 10 (Satisfied).” Figure 3-2 depicts the proportion of respondents who fell into each response category for each global rating for the Mercy Maricopa Program.

![Figure 3-2—Global Ratings: Proportion of Responses](chart)

### Figure 3-2—Global Ratings: Proportion of Responses

- **Rating of All Health Care**
  - Dissatisfied: 22.7%
  - Neutral: 33.8%

- **Satisfied**
Composite Measures

Figure 3-3 depicts the top-box global proportions for the Mercy Maricopa Program and the 2016 NCQA National Adult Medicaid average using responses of “Usually” or “Always” for top-box scoring of Getting Needed Care, Getting Care Quickly, How Well Doctors Communicate, and Customer Service, and responses of “Yes” for top-box scoring of Shared Decision Making.

![Composite Measures: Global Proportions](image-url)
For Getting Needed Care, Getting Care Quickly, How Well Doctors Communicate, and Customer Service, responses were classified into one of three response categories as follows: “Never (Dissatisfied),” “Sometimes (Neutral),” and “Usually/Always (Satisfied).” For Shared Decision Making, responses were classified into one of two response categories as follows: “No (Dissatisfied)” and “Yes (Satisfied).” Figure 3-4 depicts the proportion of respondents who fell into each response category for each composite measure for the Mercy Maricopa Program.

![Composite Measures: Proportion of Responses](Image)

**Figure 3-4—Composite Measures: Proportion of Responses**

- **Customer Service**
  - Dissatisfied: 9.9%
  - Neutral: 15.6%
  - Satisfied: 87.3%
  - N = 157

- **Getting Care Quickly**
  - Dissatisfied: 14.2%
  - Neutral: 81.1%
  - Satisfied: 75.9%
  - N = 262

- **Getting Needed Care**
  - Dissatisfied: 12.7%
  - Neutral: 85.8%
  - Satisfied: 75.9%
  - N = 309

- **How Well Doctors Communicate**
  - Dissatisfied: 24.1%
  - Neutral: 81.1%
  - Satisfied: 87.3%
  - N = 310

- **Shared Decision Making**
  - Dissatisfied: 9.9%
  - Neutral: 15.6%
  - Satisfied: 87.3%
  - N = 192

Proportion of Responses (Percent)

- **Dissatisfied**
- **Neutral**
- **Satisfied**
**Individual Item Measures**

Figure 3-5 depicts the top-box question summary rates for the Mercy Maricopa Program and the 2016 NCQA National Adult Medicaid average using responses of “Usually” or “Always” for top-box scoring of Coordination of Care, and responses of “Yes” for top-box scoring of Health Promotion and Education.

![Figure 3-5—Individual Item Measures: Question Summary Rates](image-url)

- **Coordination of Care**
  - NCQA: 73.6%
  - MMIC: 73.6%

- **Health Promotion and Education**
  - NCQA: 71.5%
  - MMIC: 71.5%

Proportion of Top-Box Responses (Percent)

- **2016 National Average**
- **MMIC**
For Coordination of Care, responses were classified into one of three response categories: “Never (Dissatisfied),” “Sometimes (Neutral),” and “Usually/Always (Satisfied).” For Health Promotion and Education, responses were classified into one of two response categories: “No (Dissatisfied)” or “Yes (Satisfied).” Figure 3-6 depicts the proportion of respondents who fell into each response category for each individual item measure for the Mercy Maricopa Program.

**Figure 3-6—Individual Item Measures: Proportion of Responses**

- **Coordination of Care**
  - Dissatisfied: 8.4%
  - Neutral: 18.1%
  - Satisfied: 73.6%
  - N = 227

- **Health Promotion and Education**
  - Dissatisfied: 28.5%
  - Satisfied: 71.5%
  - N = 361
Summary of Rates and Proportions

Evaluation of the Mercy Maricopa Program’s rates and proportions revealed the following summary results.

- The Mercy Maricopa Program scored at or above the national average on two measures: Getting Care Quickly and Getting Needed Care.
- The Mercy Maricopa Program scored below the national average on nine measures: Rating of All Health Care, Rating of Health Plan, Rating of Personal Doctor, Rating of Specialist Seen Most Often, Customer Service, How Well Doctors Communicate, Shared Decision Making, Coordination of Care, and Health Promotion and Education.
4. Recommendations

This section presents Adult Medicaid CAHPS recommendations for the Mercy Maricopa Program for each CAHPS measure. The recommendations presented in this section should be viewed as potential suggestions for quality improvement (QI). Additional sources of QI information, such as other HEDIS results, should be incorporated into a comprehensive QI plan. A number of resources are available to assist state Medicaid agencies and programs with the implementation of CAHPS-based QI initiatives. A comprehensive list of these resources is included in the Quality Improvement References subsection beginning on page 4-18.

Priority Assignments

This section defines QI priority assignments for each global rating, composite measure, and individual item measure. The priority assignments are grouped into four main categories for QI: top, high, moderate, and low priority. The priority assignments are based on the results of the NCQA comparisons. Table 4-1 shows how the priority assignments are determined for the Mercy Maricopa Program on each CAHPS measure.

<table>
<thead>

Recommendations for Quality Improvement

HSAG presented QI recommendations for the top priority assignments.

**Global Ratings**

**Rating of Health Plan**

In order to improve the overall Rating of Health Plan, QI activities should target alternatives to one-on-one visits, Contractor operations, and promoting QI initiatives. The following are recommendations of best practices and other proven strategies that may be used or adapted by the Contractor to target improvement in each of these areas.

**Alternatives to One-on-One Visits**

Contractors should engage in efforts that assist providers in examining and improving their systems’ abilities to manage patient demand. As an example, Contractors can test alternatives to traditional one-on-one visits, such as telephone consultations, telemedicine, or group visits for certain types of health care services and appointments to increase physician availability. Additionally, for patients who need a follow-up appointment, a system could be developed and tested where a nurse or physician assistant contacts the patient by phone two weeks prior to when the follow-up visit would have occurred to determine whether the patient’s current status and condition warrants an in-person visit, and if so, schedule the appointment at that time. Otherwise, an additional status follow-up contact could be made by phone in lieu of an in-person office visit. By finding alternatives to traditional one-on-one, in-office visits, Contractors can assist in improving physician availability and ensuring patients receive immediate medical care and services.

**Contractor Operations**

It is important for Contractors to view their organization as a collection of microsystems (such as providers, administrators, and other staff that provide services to members) that provide the Contractor’s health care “products.” Health care microsystems include: a team of health providers, patient/population to whom care is provided, environment that provides information to providers and patients, support staff, equipment, and office environment. The goal of the microsystems approach is to focus on small, replicable, functional service systems that enable Contractor staff to provide high-quality, patient-centered care. The first step to this approach is to define a measurable collection of activities. Once the microsystems are identified, new processes that improve care should be tested and implemented. Effective processes can then be rolled out throughout the Contractor.

**Promote Quality Improvement Initiatives**

Implementation of organization-wide QI initiatives are most successful when Contractor staff at every level are involved; therefore, creating an environment that promotes QI in all aspects of care can encourage organization-wide participation in QI efforts. Methods for achieving this can include aligning
QI goals to the mission and goals of the Contractor organization, establishing plan-level performance measures, clearly defining and communicating collected measures to providers and staff, and offering provider-level support and assistance in implementing QI initiatives. Furthermore, by monitoring and reporting the progress of QI efforts internally, Contractors can assess whether QI initiatives have been effective in improving the quality of care delivered to members.

Specific QI initiatives aimed at engaging employees can include quarterly employee forums, an annual all-staff assembly, topic-specific improvement teams, leadership development courses, and employee awards. As an example, improvement teams can be implemented to focus on specific topics such as service quality; rewards and recognition; and patient, physician, and employee satisfaction.
Rating of All Health Care

In order to improve the Rating of All Health Care measure, QI activities should target client perception of access to care and patient and family engagement advisory councils. The following are recommendations of best practices and other proven strategies that may be used or adapted by the Contractor to target improvement in each of these areas.

Access to Care

Contractors should identify potential barriers for patients receiving appropriate access to care. Access to care issues include obtaining the care that the patient and/or physician deemed necessary, obtaining timely urgent care, locating a personal doctor, or receiving adequate assistance when calling a physician office. The Contractor should attempt to reduce any hindrances a patient might encounter while seeking care. Standard practices and established protocols can assist in this process by ensuring access to care issues are handled consistently across all practices. For example, Contractors can develop standardized protocols and scripts for common occurrences within the provider office setting, such as late patients. With proactive policies and scripts in place, the late patient can be notified the provider has moved onto the next patient and will work the late patient into the rotation as time permits. This type of structure allows the late patient to still receive care without causing delay in the appointments of other patients. Additionally, having a well-written script prepared in the event of an uncommon but expected situation, allows staff to work quickly in providing timely access to care while following protocol.

Making Patient-Centered Care a Core Value

Focusing on the needs of individual patients rather than overall populations/programs provides an opportunity for Contractors to improve performance. When patients are listened to, informed, and respected, these actions strengthen the patient-clinician relationship, promote communication, help patients know and understand more about their health, and facilitate involvement in their own care. The Contractors should consider capturing aspects of what counts as patient-centered care and how it can be implemented/improved by developing measures from the perspectives of stakeholders including patients, their families, clinicians, and health systems. Other valuable information on patient experience can be taken directly from continuous samples of patient feedback. This actionable feedback can be gathered through detailed surveys, standardized patient assessments, or direct observation. These results can be widely communicated through the delivery of reports at the site, department, and individual provider levels for the continual awareness of performance improvement areas.

Patient and Family Engagement Advisory Councils

Since both patients and families have the direct experience of an illness or health care system, their perspectives can provide significant insight when performing an evaluation of health care processes. Therefore, Contractors should consider creating opportunities and functional roles that include the patients and families who represent the populations they serve. Patient and family members could serve as advisory council members providing new perspectives and serving as a resource to health care processes. Patient interviews on services received and family inclusion in care planning can be an
effective strategy for involving members in the design of care and obtaining their input and feedback on how to improve the delivery of care. Further, involvement in advisory councils can provide a structure and process for ongoing dialogue and creative problem-solving between the Contractor and its members. The councils’ roles within a Contractor organization can vary and responsibilities may include input into or involvement in: program development, implementation, and evaluation; marketing of health care services; and design of new materials or tools that support the provider-patient relationship.

Reducing Barriers to Integration of Social Services with Medical Services

Social, behavioral, and environmental factors are important factors of health when prescribing treatments for patients; therefore, Contractors should use an integration model that emphasizes a team-based clinical care approach, which connects patients to care with community resources and supports. Integrated arrangement, financing, and delivery of non-medical social services, such as food, housing, transportation, and income assistance, with medical services is important to improve outcomes, achieve cost savings, and enhance equity. Contractors can implement models for health and social services integration, so that Medicaid managed care plans can coordinate with social and community interventions that have proven to be effective in improving outcomes and reducing costs.

Telehealth Tools

Contractors should promote the use of effective telehealth tools. Telehealth technologies, such as the use of the Internet, telephone, and other methods, can help increase patient access to medical care, especially in remote, rural, or underserved areas. Some helpful telehealth tools include services that enable doctors and patients to conference over video and communicate on a secure platform through in-app text and call features. Other apps such as instructional videos, frequently asked questions (FAQs), and troubleshooting guides provide patients with a source of confidence through readily available information that allows them to solve problems without needing to contact their doctor. These tools not only limit the amount of in-office appointments, but also provide patients with crucial information outside regular office hours. Also, with the assistance of apps that allow patients the opportunity to regularly rate their satisfaction on medical equipment they have received, such as hearing aids, doctors can use the results, even between appointments, to actively intervene to their concerns in a timely manner.
Rating of Personal Doctor

In order to improve the Rating of Personal Doctor measure, QI activities should target maintaining truth in scheduling, patient-direct feedback, physician-patient communication, and improving shared decision making. The following are recommendations of best practices and other proven strategies that may be used or adapted by the Contractor to target improvement in each of these areas.

*Maintain Truth in Scheduling*

Contractors can request that all providers monitor appointment scheduling to ensure that scheduling templates accurately reflect the amount of time it takes to provide patient care during a scheduled office visit. Contractors could provide assistance or instructions to those physicians unfamiliar with this type of assessment. Patient dissatisfaction can often be the result of prolonged wait times and delays in receiving care at the scheduled appointment time. One method for evaluating appropriate scheduling of various appointment types is to measure the amount of time it takes to complete the scheduled visit. This type of monitoring will allow providers to identify if adequate time is being scheduled for each appointment type and if appropriate changes can be made to scheduling templates to ensure patients are receiving prompt, adequate care. Patient wait times for routine appointments should also be recorded and monitored to ensure that scheduling can be optimized to minimize these wait times. Additionally, by measuring the amount of time it takes to provide care, both Contractors and physician offices’ can identify where streamlining opportunities exist. If providers are finding bottlenecks within their patient flow processes, they may consider implementing daily staff huddles to improve communication or working in teams with cross-functionalities to increase staff responsibility and availability.

*Direct Patient Feedback*

Contractors can explore additional methods for obtaining direct patient feedback to improve patient satisfaction, such as comment cards. Comment cards have been utilized and found to be a simple method for engaging patients and obtaining rapid feedback on their recent physician office visit experiences. Contractors can assist in this process by developing comment cards that physician office staff can provide to patients following their visit. Comment cards can be provided to patients with their office visit discharge paperwork or via postal mail or email. Asking patients to describe what they liked most about the care they received during their recent office visit, what they liked least, and one thing they would like to see changed can be an effective means for gathering feedback (both positive and negative). Comment card questions may also prompt feedback regarding other topics, such as providers’ listening skills, wait time to obtaining an appointment, customer service, and other items of interest. Research suggests the addition of the question, “Would you recommend this physician’s office to a friend?” greatly predicts overall patient satisfaction. This direct feedback can be helpful in gaining a better understanding of the specific areas that are working well and areas which can be targeted for improvement.
Physician-Patient Communication

Contractors should encourage physician-patient communication to improve patient satisfaction and outcomes. Indicators of good physician-patient communication include providing clear explanations, listening carefully, and being understanding of patients’ perspectives. Contractors can also create specialized workshops focused on enhancing physicians’ communication skills, relationship building, and the importance of physician-patient communication. Training sessions can include topics such as improving listening techniques, patient-centered interviewing skills, collaborative communication which involves allowing the patient to discuss and share in the decision-making process, as well as effectively communicating expectations and goals of health care treatment. In addition, workshops can include training on the use of tools that improve physician-patient communication. Examples of effective tools include visual medication schedules and the “Teach Back” method, which has patients communicate back the information the physician has provided.

Improving Shared Decision Making

Contractors should encourage skills training in shared decision making for all physicians. Implementing an environment of shared decision making and physician-patient collaboration requires physician recognition that patients have the ability to make choices that affect their health care. Therefore, one key to a successful shared decision making model is ensuring that physicians are properly trained. Training should focus on providing physicians with the skills necessary to facilitate the shared decision making process; ensuring that physicians understand the importance of taking each patient’s values into consideration; and understanding patients’ preferences and needs. Effective and efficient training methods include seminars and workshops.
Rating of Specialist Seen Most Often

In order to improve the overall performance on the Rating of Specialist Seen Most Often global rating, QI activities should target planned visit management, skills training, and telemedicine. The following are recommendations of best practices and other proven strategies that may be used or adapted by the Contractor to target improvement in each of these areas.

**Planned Visit Management**

Contractors should work with providers to encourage the implementation of systems that enhance the efficiency and effectiveness of specialist care. For example, by identifying patients with chronic conditions that have routine appointments, a reminder system could be implemented to ensure that these patients are receiving the appropriate attention at the appropriate time. This triggering system could be used by staff to prompt general follow-up contact or specific interaction with patients to ensure they have necessary tests completed before an appointment or various other prescribed reasons. For example, after a planned visit, follow-up contact with patients could be scheduled within the reminder system to ensure patients understood all information provided to them and/or to address any questions they may have.

**Skills Training for Specialists**

Contractors can create specialized workshops or seminars that focus on training specialists in the skills they need to effectively communicate with patients to improve physician-patient communication. Training seminars can include sessions for improving communication skills with different cultures and handling challenging patient encounters. In addition, workshops can use case studies to illustrate the importance of communicating with patients and offer insight into specialists’ roles as both managers of care and educators of patients. According to a 2009 review of more than 100 studies published in the journal *Medical Care*, patients’ adherence to recommended treatments and management of chronic conditions is 12 percent higher when providers receive training in communication skills. By establishing skills training for specialists, Contractors can not only improve the quality of care delivered to its members but also their potential health outcomes.

**Telemedicine**

Contractors may want to explore the option of telemedicine with their provider networks to address issues with provider access in certain geographic areas. Telemedicine models allow for the use of electronic communication and information technologies to provide specialty services to patients in varying locations. Telemedicine such as live, interactive videoconferencing allows providers to offer care from a remote location. Physician specialists located in urban settings can diagnose and treat patients in communities where there is a shortage of specialists. Telemedicine consultation models allow for the local provider to both present the patient at the beginning of the consult and to participate in a case conference with the specialist at the end of the teleconference visit. Furthermore, the local provider is more involved in the consultation process and more informed about the care the patient is receiving.
Composite Measures

Getting Care Quickly

In order to improve members’ satisfaction under the Getting Care Quickly measure, QI activities should target decreasing no-show appointments, electronic communication, patient flow, and Internet access. The following are recommendations of best practices and other proven strategies that may be used or adapted by the Contractor to target improvement in each of these areas.

Decrease No-Show Appointments

Studies have indicated that reducing the demand for unnecessary appointments and increasing availability of physicians can result in decreased no-shows and improve members’ perceptions of timely access to care. Contractors can assist providers in examining patterns related to no-show appointments to determine the factors contributing to patient no-shows. For example, it might be determined that only a small percentage of the physicians’ patient population accounts for no-shows. Thus, further analysis could be conducted on this targeted patient population to determine if there are specific contributing factors (e.g., lack of transportation). Additionally, an analysis of the specific types of appointments that are resulting in no-shows could be conducted. Some findings have shown that follow-up visits account for a large percentage of no-shows. Thus, the Contractor can assist providers in re-examining their return visit patterns and eliminate unnecessary follow-up appointments or find alternative methods to conduct follow-up care (e.g., telephone and/or e-mail follow-up). Additionally, follow-up appointments could be conducted by another health care professional such as nurse practitioners or physician assistants.

Electronic Communication

Contractors should encourage the use of electronic communication where appropriate. Electronic forms of communication between patients and providers can help alleviate the demand for in-person visits and provide prompt care to patients that may not require an appointment with a physician. Electronic communication can also be used when scheduling appointments, requesting referrals, providing prescription refills, answering patient questions, educating patients on health topics, and disseminating lab results. An online patient portal can aid in the use of electronic communication and provide a safe, secure location where patients and providers can communicate. It should be noted that Health Insurance Portability and Accountability Act (HIPAA) regulations must be carefully reviewed when implementing this form of communication.

Patient Flow Analysis

Contractors should request that all providers monitor patient flow. The Contractors could provide instructions and/or assistance to those providers that are unfamiliar with this type of evaluation. Dissatisfaction with timely care is often a result of bottlenecks and redundancies in the administrative and clinical patient flow processes (e.g., diagnostic tests, test results, treatments, hospital admission, and specialty services). To address these problems, it is necessary to identify these issues and determine the
optimal resolution. One method that can be used to identify these problems is to conduct a patient flow analysis. A patient flow analysis involves tracking a patient’s experience throughout a visit or clinical service (i.e., the time it takes to complete various parts of the visit/service). Examples of steps that are tracked include wait time at check-in, time to complete check-in, wait time in waiting room, wait time in exam room, and time with provider. This type of analysis can help providers identify “problem” areas, including steps that can be eliminated or steps that can be performed more efficiently.

**Internet Access for Health Information and Advice**

In order to supplement clinician information in a more accessible, convenient, and immediate manner for patients, Contractors can provide useful and reliable sources on the Internet. This can be accomplished by including relevant health information and tools on their website or directing patients to specific external sites during office visits, in printed materials, or in emails. It is also helpful to inform members and patients on specific places to obtain this information or to provide Internet-based resources directly in the clinic in case they lack access to the Internet.
How Well Doctors Communicate

In order to improve members’ satisfaction under the How Well Doctors Communicate measure, QI activities should focus on communication tools, improving health literacy, and language barriers. The following are recommendations of best practices and other proven strategies that may be used or adapted by the Contractor to target improvement in each of these areas.

Communication Tools for Patients

Contractors can encourage patients to take a more active role in the management of their health care by providing them with the necessary tools to effectively communicate with physicians. This can include items such as “visit preparation” handouts, sample symptom logs, and health care goals and action planning forms that facilitate physician-patient communication. Furthermore, educational literature and information on medical conditions specific to their needs can encourage patients to communicate with their physicians on any questions, concerns, or expectations they may have regarding their health care and/or treatment options. Also, patients can be encouraged to bring in lists of questions to their visits that are prompted by cards or an electronic form that lists topics including symptoms and medications. Having a written record of questions about their medical conditions or the reason for their visit provides doctors with an effective way to generate communication with patients. The list also gives patients the ability to record what is discussed and what is agreed upon between the doctor and patient during the visit for future reference.

Developing Physician Communication Skills for Patient-Centered Care

Communication skills are an important component of the patient-centered care approach. Patient-centered communication can have a positive impact on patient satisfaction, adherence to treatments, and self-management of conditions. Indicators of good physician communication skills include providing clear explanations, listening carefully, checking for understanding, and being considerate of members’ perspectives. Physicians should ask questions about members’ concerns, priorities, and values and listen to their answers. Also, physicians should check for understanding by allowing members to repeat back what they understand about their conditions and the actions they will take to monitor/manage their conditions while reinforcing key messages.

Contractors can provide specialized training for staff in this area that impart effective communication skills and strategies, focus on relationship building, and stress the importance of physician-member communication. Training can also include the following fundamental functions of physician-patient communication: fostering healing relationships, exchanging information, responding to patients’ emotions, managing uncertainty, making informed decisions, enabling patient self-management, and written communication. Training physicians in the communication skills they need can be done through in-house programs or through communications programs offered by outside organizations including workshops and seminars.
**Improve Health Literacy**

Often health information is presented to patients in a manner that is too complex and technical, which can result in patient inadherence and poor health outcomes. To address this issue, Contractors should consider revising existing and creating new print materials that are easy to understand based on patients’ needs and preferences. Materials such as patient consent forms and disease education materials on various conditions can be revised and developed in new formats to aid patients’ understanding of the health information that is being presented. Further, providing training for health care workers on how to use these materials with their patients and ask questions to gauge patient understanding can help improve patients’ level of satisfaction with provider communication.

Additionally, health literacy coaching can be implemented to ease the inclusion of health literacy into physician practice. Contractors can offer a full-day workshop where physicians have the opportunity to participate in simulation training resembling the clinical setting. Workshops also provide an opportunity for Contractors to introduce physicians to the *AHRQ Health Literacy Universal Precautions Toolkit*, which can serve as a reference for devising health literacy plans.
Customer Service

In order to improve members’ satisfaction under the Customer Service measure, QI activities should focus on customer service training programs, performance measures, recognizing and rewarding success, studying patient and staff experiences, and tracking and trending member and provider issues. The following are recommendations of best practices and other proven strategies that may be used or adapted by the Contractor to target improvement in each of these areas.

Creating an Effective Customer Service Training Program

Contractor efforts to improve customer service should include implementing a training program to meet the needs of their unique work environment. Direct patient feedback should be disclosed to employees to emphasize why certain changes need to be made. Additional recommendations from employees, managers, and business administrators should be provided to serve as guidance when constructing the training program. It is important that employees receive direction and feel comfortable putting new skills to use before applying them within the work place.

The customer service training should be geared toward teaching the fundamentals of effective communication. By reiterating basic communication techniques, employees will have the skills to communicate in a professional and friendly manner. How to appropriately deal with difficult patient interactions is another crucial concern to address. Employees should feel competent in resolving conflicts and service recovery.

The key to ensuring that employees carry out the skills they learned in training is to not only provide motivation, but implement a support structure when they are back on the job so that they are held responsible. It is advised that all employees sign a commitment statement to affirm the course of action agreed upon. Contractors should ensure leadership is involved in the training process to help establish camaraderie between managers and employees and to help employees realize the impact of their role in making change.

Customer Service Performance Measures

Setting plan-level customer service standards can assist in addressing areas of concern and serve as domains for which Contractors can evaluate and modify internal customer service performance measures, such as call center representatives’ call abandonment rates (i.e., average rate of disconnects), the amount of time it takes to resolve a member’s inquiry about prior authorizations, and the number of member complaints. Collected measures should be communicated with providers and staff members. Additionally, by tracking and reporting progress internally and modifying measures as needed, customer service performance is more likely to improve.

Recognizing and Rewarding Success

To ensure successful customer service, it is important to invest in staff who have an aptitude for service. In particular, Contractors should maintain an internal rewards and recognition system, which can lead to the pursuit of, and ultimately, the achievement of performance improvement. An excellent way to
cultivate this culture of improvement within an organization is by educating new employees during orientation on how the internal reward and recognition system is linked to its philosophy of care. This develops an attitude of confidence in and enhances the relationship between the employee and the organization, which in turn creates a sense of belonging and self-worth and sparks a desire to succeed.

Contractors can implement rewards that support the entire organization and not just an individual. Such rewards include publicly posting thank-you letters from patients and families, holding routine meetings with employees and senior management to improve communication and trust, and ensuring employees have the proper training and resources to perform their job well.

**Studying Patient and Staff Experiences**

When patients and members are assured that they are being listened to, they are more likely to have a positive health care experience. Instead of assuming that the solution to a problem is already known, it can be a great benefit to try to understand the underlying issue from the perspective of the patient. Although this can be accomplished in a number of ways, reviewing patient letters of complaints and compliments, or CAHPS survey responses can often identify the proper approach to take.

One such approach is focus groups where staff and patients are led by a moderator to discuss specific information about a problem and ideal strategies for improvement. Videotaping these discussions, which often hold a lot of emotion toward the kind of service received, can have a great impact on altering the attitudes and beliefs of staff members. Another way to provide staff with the ability to realize the emotional and physical experiences a patient might have is by performing a walkthrough. This gives staff members the ability to do everything patients and families are asked to do. Similarly, with his or her permission, a staff member can accompany a patient through his or her visit. Notes taken from these experiences can be shared with leadership to help develop improvement plans.

**Tracking and Trending Member and Provider Issues**

The Contractor should continue tracking and trending member and provider issues such as the investigation and analysis of quality of care issues. This would include the continuation of a resolution process that must include follow-up with the member to assist in ensuring his or her immediate health care needs are met, a letter of closure that provides sufficient detail to ensure that the member has an understanding of the resolution of their issue as well as a Contractor contact name and telephone number to call for assistance or to express any unresolved concerns, and analysis of the effectiveness of the interventions taken.
**Individual Item Measure**

**Coordination of Care**

In order to improve members’ satisfaction under the Coordination of Care measure, QI activities should focus on evaluating call centers, customer service training programs, and performance measures. The following are recommendations of best practices and other proven strategies that may be used or adapted by the Contractor to target improvement in each of these areas.

**Coordinate Care Based on the Individual’s Goals**

When providers and physicians share an understanding of a patient’s goals, they are able to communicate and coordinate care in a way that directly impacts the outcomes and experience of the person receiving it. Coordinating goal-based care is established by creating a plan that places the individual at the center and seamlessly works with the entire care team who supports the individual, including the family and friend caregivers and medical providers. During goal planning discussions, the patient should be provided a judgment-free, respectful, and supportive environment that acknowledges them as an expert in their own life so they can articulate what is important to them, be fully informed about their options, and be a priority in the creation of shared goals. Also, forming a safe place for expression of ideas and solutions to the individual’s current status and care plan within this collaboration results in an understanding of alternative perspectives from each team member’s unique role, which leads to a better outcome that could not be achieved alone. Also, engaging all appropriate parties in these discussions on a consistent basis and quickly when urgent needs arise avoids gaps in care and provides each person with a clear understanding of their specific roles and responsibilities related to the care the individual should receive.

**Data Sharing**

Interoperable health information technology and electronic medical record systems are one key to successful Contractors. Hospitals operating within each organization should have effective communication processes in place to ensure information is shared on a timely basis. Systems should be designed to enable effective and efficient coordination of care and reporting on various aspects of quality improvement.

Contractors can enable providers to share data electronically on each client and store data in a central data warehouse so all entities can easily access information. Contractors could organize clients’ health and utilization information into summary reports that track clients’ interventions and outstanding needs. Contractors should pursue joint activities that facility coordinated, effective care, such as an urgent care option in the emergency department and combining medical and behavioral health services in primary care clinics.
Accountability and Improvement of Care

Although the administration of the CAHPS survey takes place at the program level, the accountability for the performance lies at both the program and provider network level. Table 4-3 provides a summary of the responsible parties for various aspects of care.4-1

Although performance on some of the global ratings, composite measures, and individual item measures may be driven by the actions of the provider network, the program can still play a major role in influencing the performance of provider groups through intervention and incentive programs.

Those measures identified for the Mercy Maricopa Program exhibited low performance suggest that additional analysis may be required to identify what is truly causing low performance in these areas. Methods that could be used include:

- Conducting a correlation analysis to assess if specific issues are related to overall ratings (i.e., those question items or composites that are predictors of rating scores).
- Drawing on the analysis of population sub-groups (e.g., health status, race, age) to determine if there are client groups that tend to have lower levels of satisfaction (see Tab and Banner Book).
- Using other indicators to supplement CAHPS data such as member complaints/grievances, feedback from staff, and other survey data.

• Conducting focus groups and interviews to determine what specific issues are causing low satisfaction ratings.

After identification of the specific problem(s), then necessary QI activities could be developed. However, the methodology for QI activity development should follow a cyclical process (e.g., Plan-Do-Study-Act [PDSA]) that allows for testing and analysis of interventions in order to assure that the desired results are achieved.
Quality Improvement References

The CAHPS surveys were originally developed to meet the need of consumers for usable, relevant information on quality of care from the members’ perspective. However, they also play an important role as a QI tool for health care organizations, which can use the standardized data and results to identify relative strengths and weaknesses in their performance, determine where they need to improve, and track their progress over time. The following references offer guidance on possible approaches to CAHPS-related QI activities.

5. Reader’s Guide

This section provides a comprehensive overview of CAHPS, including the CAHPS survey administration protocol and analytic methodology. It is designed to provide supplemental information to the reader that may aid in the interpretation and use of the CAHPS results presented in this report.

Survey Administration

Survey Overview

The survey instrument selected was the CAHPS 5.0 Adult Medicaid Health Plan Survey with the HEDIS supplemental item set. The CAHPS 5.0 Health Plan Surveys are a set of standardized surveys that assess patient perspectives on care. Originally, CAHPS was a five-year collaborative project sponsored by AHRQ. The CAHPS questionnaires and consumer reports were developed under cooperative agreements among AHRQ, Harvard Medical School, RAND, and the Research Triangle Institute (RTI). In 1997, NCQA, in conjunction with AHRQ, created the CAHPS 2.0H Survey measure as part of NCQA’s HEDIS.5-1 In 2002, AHRQ convened the CAHPS Instrument Panel to re-evaluate and update the CAHPS Health Plan Surveys and to improve the state-of-the-art methods for assessing members’ experiences with care.5-2 The result of this re-evaluation and update process was the development of the CAHPS 3.0H Health Plan Surveys. The goal of the CAHPS 3.0H Health Plan Surveys was to effectively and efficiently obtain information from the person receiving care. In 2006, AHRQ released the CAHPS 4.0 Health Plan Surveys. Based on the CAHPS 4.0 versions, NCQA introduced new HEDIS versions of the Adult Health Plan Survey in 2007 and the Child Health Plan Survey in 2009, which are referred to as the CAHPS 4.0H Health Plan Surveys.5-3,5-4 In 2012, AHRQ released the CAHPS 5.0 Health Plan Surveys. Based on the CAHPS 5.0 versions, NCQA introduced new HEDIS versions of the Adult and Child Health Plan Surveys in August 2012, which are referred to as the CAHPS 5.0H Health Plan Surveys.5-5

The sampling and data collection procedures for the CAHPS 5.0 Health Plan Surveys are designed to capture accurate and complete information about consumer-reported experiences with health care. The

sampling and data collection procedures promote both the standardized administration of survey instruments and the comparability of the resulting data.

The CAHPS 5.0 Adult Medicaid Health Plan Survey with the HEDIS supplemental item set includes 58 core questions that yield 11 measures of satisfaction. These measures include four global rating questions, five composite measures, and two individual item measures. The global measures (also referred to as global ratings) reflect overall satisfaction with the Contractor, health care, personal doctors, and specialists. The composite measures are sets of questions grouped together to address different aspects of care (e.g., “Getting Needed Care” or “Getting Care Quickly”). The individual item measures are individual questions that look at a specific area of care (e.g., “Coordination of Care” and “Health Promotion and Education”).

Table 5-1 lists the global ratings, composite measures, and individual item measures included in the CAHPS 5.0 Adult Medicaid Health Plan Survey with the HEDIS supplemental item set.

**Sampling Procedures**

The members eligible for sampling included those who were Mercy Maricopa Program members at the time the sample was drawn and who were continuously enrolled for at least five of the last six months of the measurement period (October 2015 through March 2016). The members eligible for sampling included those who were 18 years of age or older (as of March 31, 2016). A sample of 1,620 adult members was selected from the Mercy Maricopa Program’s eligible population.
Survey Protocol

The CAHPS Health Plan Survey process allows for two methods by which members can complete a survey. The first, or mail phase, consisted of a survey being mailed to all sampled members. For the Mercy Maricopa Program, those members who were identified as Spanish-speaking through administrative data were mailed a Spanish version of the survey. The cover letter provided with the Spanish version of the CAHPS questionnaire included a text box with a toll-free number that members could call to request a survey in another language (i.e., English). Members that were not identified as Spanish-speaking received an English version of the survey. The cover letter included with the English version of the survey had a Spanish cover letter on the back side informing members that they could call the toll-free number to request a Spanish version of the CAHPS questionnaire. A reminder postcard was sent to all non-respondents, followed by a second survey mailing and reminder postcard. The second phase, or telephone phase, consisted of CATI of sampled members who had not mailed in a completed survey. A series of up to six CATI calls was made to each non-respondent. It has been shown that the addition of the telephone phase aids in the reduction of non-response bias by increasing the number of respondents who are more demographically representative of a Contractor’s population.\(^5^6\)

HSAG was provided a list of all eligible members for the sampling frame. HSAG sampled members who met the following criteria:

- Were age 18 or older as of March 31, 2016.
- Were currently enrolled in the Mercy Maricopa Program.
- Had been continuously enrolled for at least five of the six months from October 1, 2015 to March 31, 2016.
- Had Medicaid as a payer.

HSAG inspected a sample of the file records to check for any apparent problems with the files, such as missing address elements. After the sample was selected, records from each population were passed through the United States Postal Service’s National Change of Address (NCOA) system to obtain new addresses for members who had moved (if they had given the Postal Service a new address). Prior to initiating CATI, HSAG employed the Telematch telephone number verification service to locate and/or update telephone numbers for all non-respondents. The survey samples were systematic samples with no more than one member being selected per household.

The specifications also require that the name of the program appear in the questionnaires, letters, and postcards; that the letters and cards bear the signature of a high-ranking plan or state official; and that the questionnaire packages include a postage-paid reply envelope addressed to the organization conducting the surveys. HSAG followed these specifications.

Table 5-2 shows the CAHPS timeline used in the administration of the Mercy Maricopa Program’s CAHPS 5.0 Adult Medicaid Health Plan Survey. The timeline is based on NCQA HEDIS Specifications for Survey Measures.\textsuperscript{5-7}

</table>

Methodology

HSAG used the CAHPS scoring approach recommended by NCQA in Volume 3 of HEDIS Specifications for Survey Measures. Based on NCQA’s recommendations and HSAG’s extensive experience evaluating CAHPS data, a number of analyses were performed to comprehensively assess member satisfaction with the Mercy Maricopa Program. This section provides an overview of each analysis.

Response Rates

The administration of the CAHPS Adult Medicaid Health Plan Survey is comprehensive and is designed to achieve the highest possible response rate. NCQA defines the response rate as the total number of completed surveys divided by all eligible members of the sample.\(^{5-8}\) A survey is assigned a disposition code of “completed” if at least three of the following five questions were answered: questions 3, 15, 24, 28, and 35. Eligible members include the entire sample (including any oversample) minus ineligible members. Ineligible members of the sample met one or more of the following criteria: were deceased, were invalid (did not meet criteria described on page 5-3), were mentally or physically incapacitated, or had a language barrier.

\[
\text{Response Rate} = \frac{\text{Number of Completed Surveys}}{\text{Sample - Ineligibles}}
\]

Respondent Demographics

The demographic analysis evaluated self-reported demographic information from survey respondents. Given that the demographics of a response group may influence overall member satisfaction scores, it is important to evaluate all CAHPS results in the context of the actual respondent population. If the respondent population differs significantly from the actual population of the program, then caution must be exercised when extrapolating the CAHPS results to the entire population.

NCQA Comparisons

An analysis of the Mercy Maricopa Program’s CAHPS 5.0 Adult Medicaid Health Plan Survey results was conducted using NCQA HEDIS Specifications for Survey Measures. Per these specifications, no weighting or case-mix adjustment is performed on the results. NCQA also requires a minimum of 100 responses on each item in order to obtain a reportable CAHPS Survey result.

In order to perform the NCQA comparisons, a three-point mean score was determined for each CAHPS measure. The resulting three-point mean scores were compared to published NCQA Benchmarks and Thresholds to derive the overall member satisfaction ratings (i.e., star ratings) for each CAHPS measure, except for the Shared Decision Making composite and Health Promotion and Education individual item measure. NCQA does not publish benchmarks and thresholds for these measures; therefore, star ratings could not be assigned. For detailed information on the derivation of three-point mean scores, please refer to NCQA HEDIS 2017 Specifications for Survey Measures, Volume 3.

Ratings of one (★) to five (★★★★★) stars were determined for each CAHPS measure using the following percentile distributions:

★★★★★ indicates a score at or above the 90th percentile
★★★★ indicates a score at or between the 75th and 89th percentiles
★★★ indicates a score at or between the 50th and 74th percentiles
★★ indicates a score at or between the 25th and 49th percentiles
★ indicates a score below the 25th percentile

5-10 NCQA’s benchmarks and thresholds for the adult Medicaid population were used to derive the overall satisfaction ratings; therefore, caution should be exercised when interpreting these results.
Table 5-3 shows the benchmarks and thresholds used to derive the overall member satisfaction ratings on each CAHPS measure.5-11

Rates and Proportions

Rates and proportions were presented that compared member satisfaction performance between the Mercy Maricopa Program and the 2016 NCQA National Adult Medicaid average. For purposes of this analysis, question summary rates were calculated for each global rating and individual item measure, and global proportions were calculated for each composite measure. Both the question summary rates and global proportions were calculated in accordance with NCQA HEDIS Specifications for Survey Measures.5-12 The scoring of the global ratings, composite measures, and individual item measures involved assigning top-level responses a score of one, with all other responses receiving a score of zero. After applying this scoring methodology, the percentage of top-level responses was calculated in order to determine the question summary rates and global proportions. For additional detail, please refer to the NCQA HEDIS 2017 Specifications for Survey Measures, Volume 3.

Limitations and Cautions

The findings presented in this CAHPS report are subject to some limitations in the survey design, analysis, and interpretation. These limitations should be considered carefully when interpreting or generalizing the findings. These limitations are discussed below.

Case-Mix Adjustment

As described in the respondent demographics subsection, the demographics of a response group may impact member satisfaction. Therefore, differences in the demographics of the response group may impact CAHPS results. NCQA does not recommend case-mix adjusting Medicaid CAHPS results to account for these differences.5-13

Non-Response Bias

The experiences of the survey respondent population may be different than that of non-respondents with respect to their health care services. Therefore, the potential for non-response bias should be considered when interpreting CAHPS results.

Causal Inferences

Although this report examines whether members report differences in satisfaction with various aspects of their health care experiences, these differences may not be completely attributable to the Mercy Maricopa Program. The survey by itself does not necessarily reveal the exact cause of these differences. As such, caution should be exercised when interpreting these results.

Baseline Results

The 2016 CAHPS results presented in the report represent a baseline assessment of members’ satisfaction with the Mercy Maricopa Program; therefore, caution should be exercised when interpreting results.

Proxy Response Bias

It is important to note that for the Mercy Maricopa Program approximately 24 percent of adult members who returned a completed survey required a proxy (i.e., another individual’s assistance with completing the survey). Given the high percentage of proxy respondents and potential for proxy response bias, caution should be exercised when interpreting the CAHPS results presented in this report.
6. Survey Instrument

The survey instrument selected for the 2016 Mercy Maricopa Program Adult Medicaid Member Satisfaction Survey was the CAHPS 5.0 Adult Medicaid Health Plan Survey with the HEDIS supplemental item set. This section provides a copy of the survey instrument.
Your privacy is protected. The research staff will not share your personal information with anyone without your OK. Personally identifiable information will not be made public and will only be released in accordance with federal laws and regulations.

You may choose to answer this survey or not. If you choose not to, this will not affect the benefits you get. You may notice a number on the cover of this survey. This number is ONLY used to let us know if you returned your survey so we don’t have to send you reminders.

If you want to know more about this study, please call 1-877-455-9242.

Please be sure to fill the response circle completely. Use only black or blue ink or dark pencil to complete the survey.

Correct Mark ⬜ Incorrect Marks ☠ ✅ ☐

You are sometimes told to skip over some questions in the survey. When this happens you will see an arrow with a note that tells you what question to answer next, like this:

● Yes ➔ Go to Question 1
○ No

START HERE

1. Our records show that you are now in [HEALTH PLAN NAME]. Is that right?

○ Yes ➔ Go to Question 3
○ No

2. What is the name of your health plan? (Please print)
YOUR HEALTH CARE IN THE LAST 6 MONTHS

These questions ask about your own health care. Do not include care you got when you stayed overnight in a hospital. Do not include the times you went for dental care visits.

3. In the last 6 months, did you have an illness, injury, or condition that needed care right away in a clinic, emergency room, or doctor's office?
   ○ Yes
   ○ No ➔ Go to Question 5

4. In the last 6 months, when you needed care right away, how often did you get care as soon as you needed?
   ○ Never
   ○ Sometimes
   ○ Usually
   ○ Always

5. In the last 6 months, did you make any appointments for a check-up or routine care at a doctor's office or clinic?
   ○ Yes
   ○ No ➔ Go to Question 7

6. In the last 6 months, how often did you get an appointment for a check-up or routine care at a doctor's office or clinic as soon as you needed?
   ○ Never
   ○ Sometimes
   ○ Usually
   ○ Always

7. In the last 6 months, not counting the times you went to an emergency room, how many times did you go to a doctor's office or clinic to get health care for yourself?
   ○ None ➔ Go to Question 15
   ○ 1 time
   ○ 2
   ○ 3
   ○ 4
   ○ 5 to 9
   ○ 10 or more times

8. In the last 6 months, did you and a doctor or other health provider talk about specific things you could do to prevent illness?
   ○ Yes
   ○ No

9. In the last 6 months, did you and a doctor or other health provider talk about starting or stopping a prescription medicine?
   ○ Yes
   ○ No ➔ Go to Question 13

10. Did you and a doctor or other health provider talk about the reasons you might want to take a medicine?
    ○ Yes
    ○ No

11. Did you and a doctor or other health provider talk about the reasons you might not want to take a medicine?
    ○ Yes
    ○ No
12. When you talked about starting or stopping a prescription medicine, did a doctor or other health provider ask you what you thought was best for you?
   ○ Yes
   ○ No

13. Using any number from 0 to 10, where 0 is the worst health care possible and 10 is the best health care possible, what number would you use to rate all your health care in the last 6 months?
